## Propeller Chip Quick Reference Spin Language

| Spin Language   |                       |   |  |  |
|---|-----------------------|---|--|--|
| Command   | Returns<br>Value      | Description   |  |  |
| ABORT 〈Value〉   | ✓                     | Exit from <b>PUB/PRI</b> method using abort status with optional return value.  |  |  |
| BYTE Symbol ([Count])   |                       | Declare byte-sized symbol in VAR block.   |  |  |
| (Symbol) BYTE Data ([Count])  |                       | Declare byte-aligned and/or byte-sized data in DAT block.   |  |  |
| BYTE [BaseAddress] ([Offsef])   | ✓                     | Read/write byte of main memory.   |  |  |
| Symbol.BYTE ([Offset])  | ✓                     | Read/write byte-sized component of word/long-sized variable.  |  |  |
| BYTEFILL (StartAddress, Value, Count)   |                       | Fill bytes of main memory with a value.   |  |  |
| BYTEMOVE (DestAddress, SrcAddress, Count)   |                       | Copy bytes from one region to another in main memory.   |  |  |
| CASE CaseExpression   |                       |   |  |  |
| →1 MatchExpression :<br>→1 Statement(s)<br>⟨→1 MatchExpression :<br>→1 Statement(s)⟩<br>⟨→1 OTHER :<br>→1 Statement(s)⟩   |                       | Compare expression against matching expression(s), execute code block if match found. <i>MatchExpression</i> can contain a single expression or multiple comma-delimited expressions. Expressions can be a single value (ex: 10) or a range of values (ex: 1015). |  |  |
| CHIPVER   | ✓                     | Version number of the Propeller chip.   |  |  |
| CLKFREQ   | ✓                     | Current System Clock frequency, in Hz.  |  |  |
| CLKMODE   | ✓                     | Current clock mode setting.   |  |  |
| CLKSET (Mode, Frequency)  |                       | Set both clock mode and System Clock frequency at run time.   |  |  |
| CNT   | ✓                     | Current 32-bit System Counter value.  |  |  |
| COGID   | · ·                   | Current cog's ID number; 0-7.   |  |  |
|   | •                     |   |  |  |
| COGINIT (CogID, SpinMethod (ParameterList)), StackPointer)  |                       | Start or restart cog by ID to run Spin code.  |  |  |
| COGINIT (CogID, AsmAddress, Parameter)  |                       | Start or restart cog by ID to run Propeller Assembly code.  |  |  |
| COGNEW (SpinMethod ( ParameterList) ), StackPointer)  | ✓                     | Start new cog for Spin code and get cog ID; 0-7 = succeeded, -1 = failed.   |  |  |
| COGNEW (AsmAddress, Parameter)  | ✓                     | Start new cog for Propeller Assembly code and get cog ID; 0-7 = succeeded, -1 = failed.   |  |  |
| COGSTOP (CogID)   |                       | Stop cog by its ID.   |  |  |
| $\begin{array}{c} \text{CON} \\ Sym = Exp \ \langle ((, \mid \hookrightarrow)) \ Sym = Exp \rangle \dots \end{array}$   |                       | Declare symbolic, global constants.   |  |  |
| $ \begin{array}{c} \text{CON} \\ \langle \texttt{*}Exp\left((, \mid \rightarrowtail)\right) \rangle Sym\langle [Ofs] \rangle \langle \langle ((, \mid \hookrightarrow)) \texttt{*}Exp \rangle ((, \mid \hookrightarrow)) Sym\langle [Ofs] \rangle \rangle \\ \end{array} $  |                       | Declare global enumerations (incrementing symbolic constants).  |  |  |
| CONSTANT (ConstantExpression)   | ✓                     | Declare in-line constant expression to be completely resolved at compile time.  |  |  |
| CTRA  | ✓                     | Counter A Control register.   |  |  |
| CTRB  | ✓                     | Counter B Control register.   |  |  |
| DAT<br><pre>Symboly Alignment <size <="" pre=""> <pre> </pre> <pre> </pre> </size></pre> <pre> </pre> <pre> Data </pre> <pre> </pre> |                       | Declare table of data, aligned and sized as specified.  |  |  |
| DAT<br>(Symbol) (Condition) Instruction (Effect(s))   |                       | Denote Propeller Assembly instruction.  |  |  |
| DIRA ([Pin(s)])   | ✓                     | Direction register for 32-bit port A.   |  |  |
| FILE "FileName"   |                       | Import external file as data in <b>DAT</b> block.   |  |  |
| FLOAT (IntegerConstant)   | ✓                     | Convert integer constant expression to compile-time floating-point value in any block.  |  |  |
| FRQA  | · ·                   | Counter A Frequency register.   |  |  |
| FRQB  | ▼<br>✓                | Counter A Frequency register.   |  |  |
| $ \begin{array}{ll} \left( \left( \mathbf{IF} & \mathbf{IFNOT} \right) \right) & Condition(s) \\ \rightarrow & IfStatement(s) \\ \left\langle \mathbf{ELSEIF} & Condition(s) \\ \rightarrow & IsselfStatement(s) \right\rangle \dots \\ \left\langle \mathbf{ELSEIFNOT} & Condition(s) \\ \rightarrow & IsselfStatement(s) \right\rangle \dots \end{array} $  |                       | Test condition(s) and execute block of code if valid.<br>IF and ELSEIF each test for TRUE. IFNOT and ELSEIFNOT each test for FALSE.   |  |  |
| ⟨ELSE<br>→ <i>ElseStatement(s)</i> ⟩  |                       |   |  |  |
|   | <ul> <li>✓</li> </ul> | Input register for 32-bit ports A.  |  |  |
| LOCKCLR ( <i>ID</i> )   | ✓                     | Clear semaphore to false and get its previous state; TRUE or FALSE.   |  |  |
| LOCKNEW   | ✓                     | Check out new semaphore and get its ID; 0-7, or -1 if none were available.  |  |  |
| LOCKRET (ID)  |                       | Return semaphore back to semaphore pool, releasing it for future LOCKNEW requests.  |  |  |
| LOCKSET ( <i>ID</i> )   | ✓                     | Set semaphore to true and get its previous state; TRUE or FALSE.  |  |  |
| LONG Symbol ([Count])   | I                     | Declare long-sized symbol in VAR block.   |  |  |
| (Symbol) LONG Data ([Count])  | İ                     | Declare long-aligned and/or long-sized data in DAT block.   |  |  |
| LONG [BaseAddress] <[Offsef]>   | ✓                     | Read/write long of main memory.   |  |  |
| LONGFILL (StartAddress, Value, Count)   | <u> </u>              | Fill longs of main memory with a value.   |  |  |
|   | <u> </u>              |   |  |  |
| LONGMOVE (DestAddress, SrcAddress, Count)   |                       | Copy longs from one region to another in main memory.   |  |  |
| LOOKDOWN (Value: ExpressionList)  | <ul> <li>✓</li> </ul> | Get the one-based index of a value in a list.   |  |  |
| LOOKDOWNZ (Value: ExpressionList)   | ✓                     | Get the zero-based index of a value in a list.  |  |  |
| LOOKUP (Index: ExpressionList)  | ✓                     | Get value from a one-based index position of a list.  |  |  |
| LOOKUPZ (Index: ExpressionList)   | 1                     | Get value from a zero-based index position of a list.   |  |  |
| NEXT  | ſ                     | Skip remaining statements of <b>REPEAT</b> loop and continue with the next loop iteration.  |  |  |
|   |                       |   |  |  |

| Spin Language (continued)   |                  |   |  |  |
|---|------------------|---|--|--|
| Command   | Returns<br>Value | Description   |  |  |
| OBJ         Symbol <[Count]>:"Object" < → Symbol <[Count]>: "Object">                                       |                  | Declare symbol object references.   |  |  |
| OUTA ([ <i>Pin(s</i> ]])  | ✓                | Output register for 32-bit port A.  |  |  |
| PAR   | ✓                | Cog Boot Parameter register.  |  |  |
| PHSA  | ✓                | Counter A Phase Lock Loop (PLL) register.   |  |  |
| PHSB  | ✓                | Counter B Phase Lock Loop (PLL) register.   |  |  |
| <b>PRI</b> Name ((Par (, Par))) (: RVal) (  LVar ([Cnl])) (, LVar ([Cnl]))<br>SourceCodeStatements          |                  | Declare private method with optional parameters, return value and local variables.        |  |  |
| <b>PUB</b> Name ((Par (, Par))) (: RVal) (  LVar ([Cnl])) (, LVar ([Cnl]))<br>SourceCodeStatements          |                  | Declare public method with optional parameters, return value and local variables.         |  |  |
| QUIT  |                  | Exit from <b>REPEAT</b> loop immediately.   |  |  |
| REBOOT  |                  | Reset the Propeller chip.   |  |  |
| REPERT ⟨Count⟩<br>→ Statement(s)  |                  | Execute code block repetitively, either infinitely, or for a finite number of iterations. |  |  |
| REPEAT Variable FROM Start TO Finish ⟨STEP Delta⟩<br>→ Statement(s)   |                  | Execute code block repetitively, for finite, counted iterations.                          |  |  |
| REPEAT ((UNTIL   WHILE))       Condition(s)         →I       Statement(s)                                   |                  | Execute code block repetitively, zero-to-many conditional iterations.                     |  |  |
| REPEAT<br>→ Statement(s)<br>((UNTIL   WHILE)) Condition(s)  |                  | Execute code block repetitively, one-to-many conditional iterations.                      |  |  |
| RESULT  | ✓                | Return value variable for PUB/PRI methods.  |  |  |
| RETURN (Value)  | ✓                | Exit from PUB/PRI method with optional return Value.                                      |  |  |
| ROUND (FloatConstant)   | ✓                | Round floating-point constant to the nearest integer at compile-time, in any block.       |  |  |
| SPR [Index]   | ✓                | Special Purpose Register array.   |  |  |
| STRCOMP (StringAddress1, StringAddress2)  | ✓                | Compare two strings for equality.   |  |  |
| STRING (StringExpression)   | ✓                | Declare in-line string constant and get its address.                                      |  |  |
| STRSIZE (StringAddress)   | ✓                | Get size, in bytes, of zero-terminate string.   |  |  |
| TRUNC (FloatConstant)   | ✓                | Remove fractional portion from floating-point constant at compile-time, in any block.     |  |  |
| VAR<br>Size Symbol $\langle [Count] \rangle \langle ((, \Box Size)) Symbol \langle [Count] \rangle \rangle$ |                  | Declare symbolic global variables.  |  |  |
| VCFG  | ✓                | Video Configuration register.   |  |  |
| VSCL  | ✓                | Video Scale register.   |  |  |
| WRITCNT (Value)   |                  | Pause cog's execution temporarily.  |  |  |
| WRITPEQ (State, Mask, Port)   |                  | Pause cog's execution until I/O pin(s) match designated state(s).                         |  |  |
| WRITPNE (State, Mask, Port)   |                  | Pause cog's execution until I/O pin(s) do not match designated state(s).                  |  |  |
| WRITVID (Colors, Pixels)  |                  | Pause cog's execution until its Video Generator is available for pixel data.              |  |  |
| WORD Symbol ([Count])   |                  | Declare word-sized symbol in VAR block.   |  |  |
| <pre> (Symbol) WORD Data ([Count]) </pre>   |                  | Declare word-aligned and/or word-sized data in DAT block.                                 |  |  |
| WORD [BaseAddress] ([Offsel])   | ✓                | Read/write word of main memory.   |  |  |
| Symbol.WORD ([Offsef])  | ✓                | Read/write word-sized component of long-sized variable.                                   |  |  |
| WORDFILL (StartAddress, Value, Count)   |                  | Fill words of main memory with a value.   |  |  |
| WORDMOVE (DestAddress, SrcAddress, Count)   |                  | Copy words from one region to another in main memory.                                     |  |  |

|   | Propeller Assembly Language                |  |   |                         |                   |             |             |
|---|--|--|---|-------------------------|-------------------|-------------|-------------|
|   | Instructio                                 |  | Description   | Z Result                | _ C Result _      | Result      | Clocks      |
| ABS   | AValue,                                    | <b>(#</b> ) <i>SValue</i>  | Get absolute value of a number.   | Result = 0              | S[31]             | Written     | 4           |
| ABSNEG  | NValue,                                    | <b>⟨#</b> ⟩ <i>SValue</i>  | Get the negative of a number's absolute value.  | Result = 0              | S[31]             | Written     | 4           |

Hub instructions require 7 to 22 clock cycles to execute depending on the relation between its moment of execution and the cog's hub access window. Since cogs run independent of the hub, they must sync to the hub to execute hub instructions. Cogs receive an "access window" every 16 clocks. The first hub instruction in a sequence will take 0 to 15 clocks to sync and 7 clocks afterwards to execute; 0+7 to 15+7 = 7 to 22 clock cycles. After that instruction, there are 9 (16–7) free clocks before the cog's next access window; enough time for two 4-clock instructions. Beware that hub instructions can cause timing to appear indeterminate; particularly the first hub instruction in a sequence.

\*\* Conditional-Jump instructions require extra clock cycles if a jump is not required. These instructions take 4 clock cycles if a jump is required and 8 clock cycles if no jump is required. Since loops utilizing these instructions typically need to be fast, they are optimized in this way for speed. Propeller Quick Reference v1.5 • 10/19/2007 • © Parallax Inc. | RCFAST                | Internal fast oscillator: \$00000001 (%0000000001)                 |  |  |  |  |
| RCSLOW                | Internal slow oscillator: \$00000002 (%0000000010)                 |  |  |  |  |
| XINPUT                | External clock/oscillator: \$00000004 (%0000000100)                |  |  |  |  |
| XTAL1                 | External low-speed crystal: \$00000008 (%0000001000)               |  |  |  |  |
| XTAL2                 | External medium-speed crystal: \$00000010 (%00000010000)           |  |  |  |  |
| XTAL3                 | External high-speed crystal: \$00000020 (%00000100000)             |  |  |  |  |
| PLL1X                 | External frequency times 1: \$00000040 (%00001000000)              |  |  |  |  |
| PLL2X                 | External frequency times 2: \$0000080 (%0001000000)                |  |  |  |  |
| PLL4X                 | External frequency times 4: \$00000100 (%0010000000)               |  |  |  |  |
| PLL8X                 | External frequency times 8: \$00000200 (%0100000000)               |  |  |  |  |
| PLL16X                | External frequency times 16: \$00000400 (%1000000000)              |  |  |  |  |

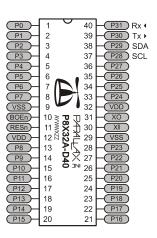

<sup>1</sup> "Settable" constants are defined in Top Object File's CON block. Most expect whole numbers, however \_CLKMODE uses Valid Clock Modes, below.

|   | Valid Clo   | ck Modes   |  |
|---|---|--|--|
| Valid Expression  | CLK Reg. Value  | Valid Expression   | CLK Reg. Value   |
| RCFAST  | 0_0_0_00_000  | XTAL1 + PLL1X<br>XTAL1 + PLL2X   | 0_1_1_01_011<br>0 1 1 01 100                               |
| RCSLOW  | 0_0_0_00_001  | XTAL1 + PLL4X  | 0_1_1_01_101   |
